Performing and tracking imputation

DEALING WITH MISSING DATA IN R

Nicholas Tierney
Statistician

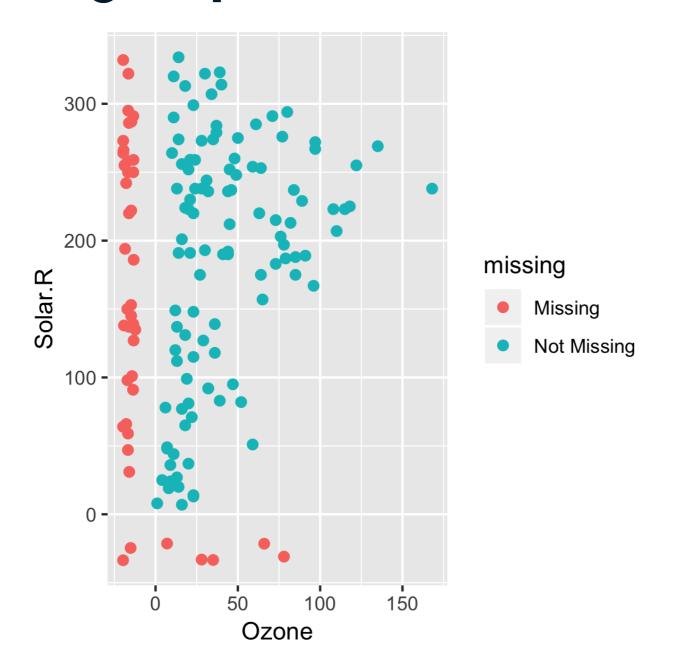

Lesson overview

Using imputations to understand data structure

Visualizing + exploring imputed values

- Imputing data to explore missingness
- Track missing values
- Visualize imputed values against data

Using imputations to understand data structure

impute_below(c(5,6,7,NA,9,10))

5.00000 6.00000 7.00000 4.40271 9.00000 10.00000

impute_below

impute_below_if(): impute_below_if(data, is.numeric) impute_below_at(): impute_below_at(data, vars(var1,var2)) impute_below_all(): impute_below_all(data)

Tracking missing values

```
df
```

```
# A tibble: 6 x 1
   var1
  <dbl>
      5
      6
3
     NA
5
      9
6
     10
```

```
impute_below_all(df)
```

```
# A tibble: 6 x 1
   var1
  <dbl>
   6
  4.40
5
6 10
```

Tracking missing values

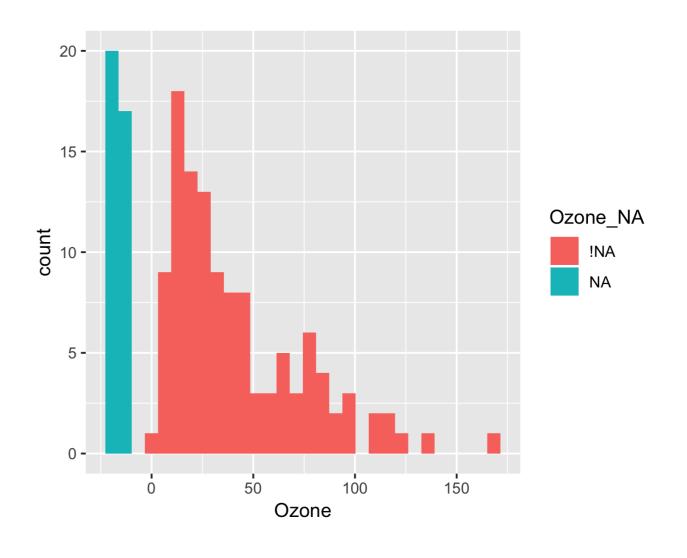

```
bind_shadow(df)
```

```
bind_shadow(df) %>% impute_below_all()
```

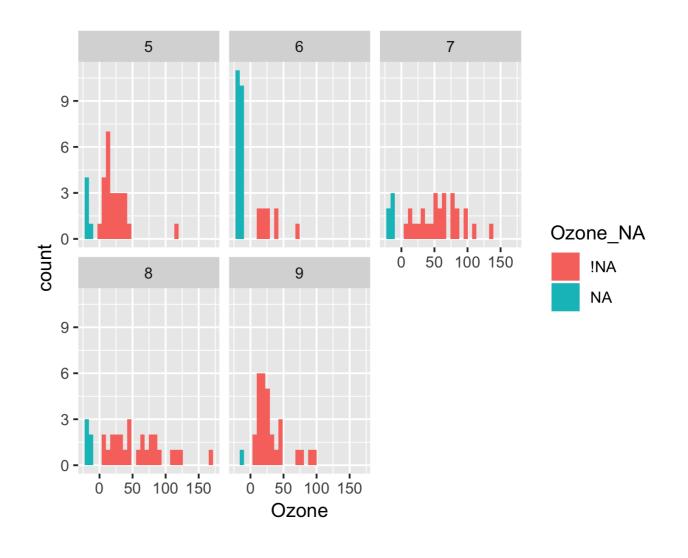

```
# A tibble: 6 x 2
   var1 var1_NA
  <dbl> <fct>
        !NA
        !NA
        !NA
   7
   NA
         NA
        !NA
        !NA
6 10
```

```
# A tibble: 6 x 2
   var1 var1_NA
  <dbl> <fct>
        !NA
     !NA
        !NA
   4.40 NA
5
        !NA
6 10
        !NA
```

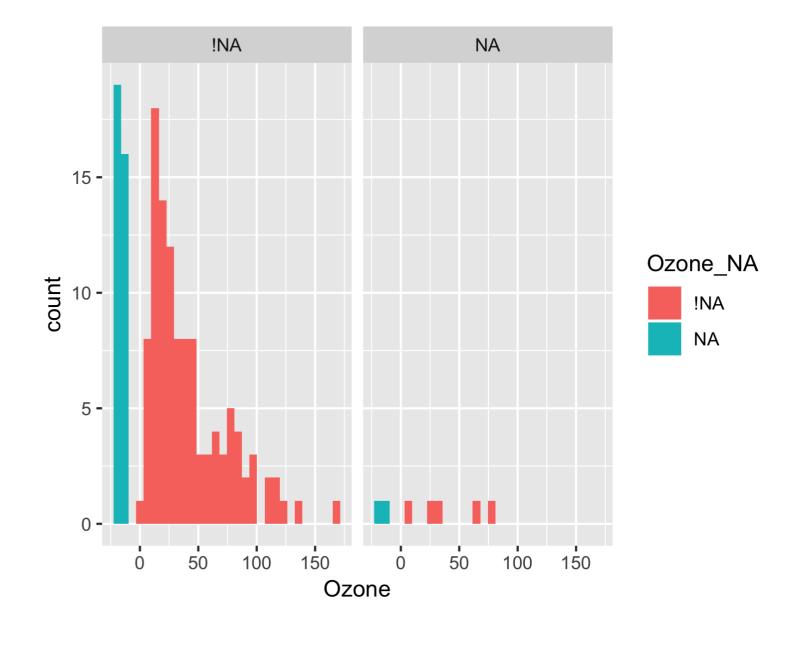

Visualize imputed values against data values using histograms

Visualize imputed values against data values using facets

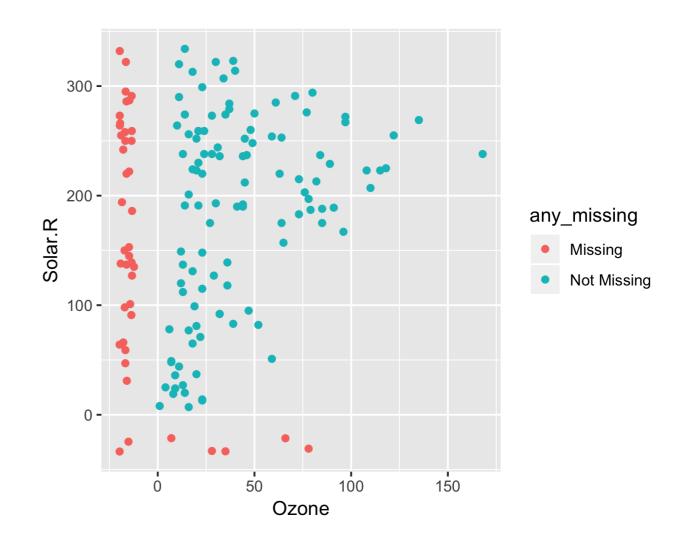

Visualize imputed values using facets

Visualize imputed values against data values using scatter plots

```
aq_imp <- airquality %>%
  bind_shadow() %>%
  add_label_shadow() %>%
  impute_below_all()
ggplot(aq_imp,
       aes(x = 0zone,
           y = Solar.R,
           color = any_missing)) +
  geom_point()
```

Let's practice!

DEALING WITH MISSING DATA IN R

What makes a good imputation

DEALING WITH MISSING DATA IN R

Nicholas Tierney
Statistician

Lesson overview

- Understand good and bad imputations
- Evaluate missing values:
 - Mean, Scale, Spread
- Using visualizations
 - Box plots
 - Scatter plots
 - Histograms
 - Many variables

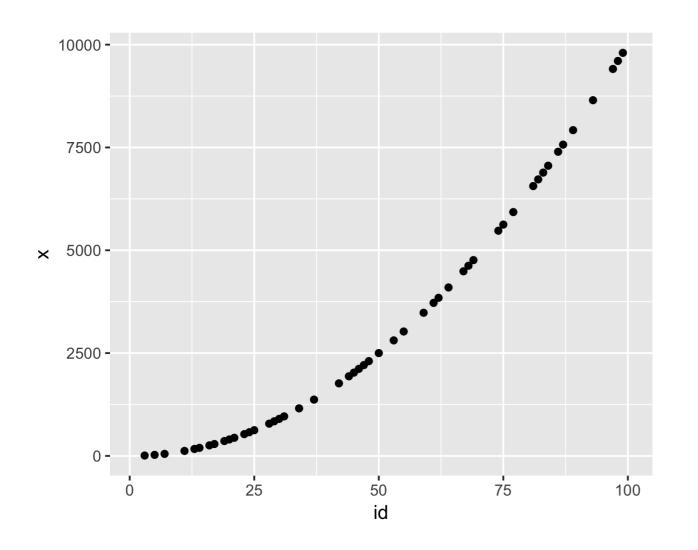

Understanding the good by understanding the bad

```
mean(df$x, na.rm = TRUE)
```

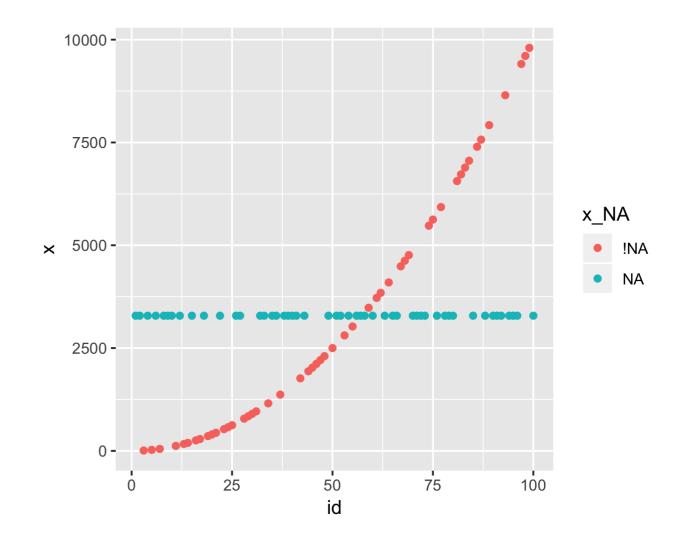

```
13.2
```

Demonstrating mean imputation

Data with missing values

Data with mean imputations

Explore bad imputations: The mean

- impute_mean(data\$variable)
- impute_mean_if(data, is.numeric)
- impute_mean_at(data, vars(variable1, variable2))
- impute_mean_all(data)

Tracking missing values

```
aq_impute_mean <- airquality %>%
  bind_shadow(only_miss = TRUE) %>%
  impute_mean_all() %>%
  add_label_shadow()
aq_impute_mean
```

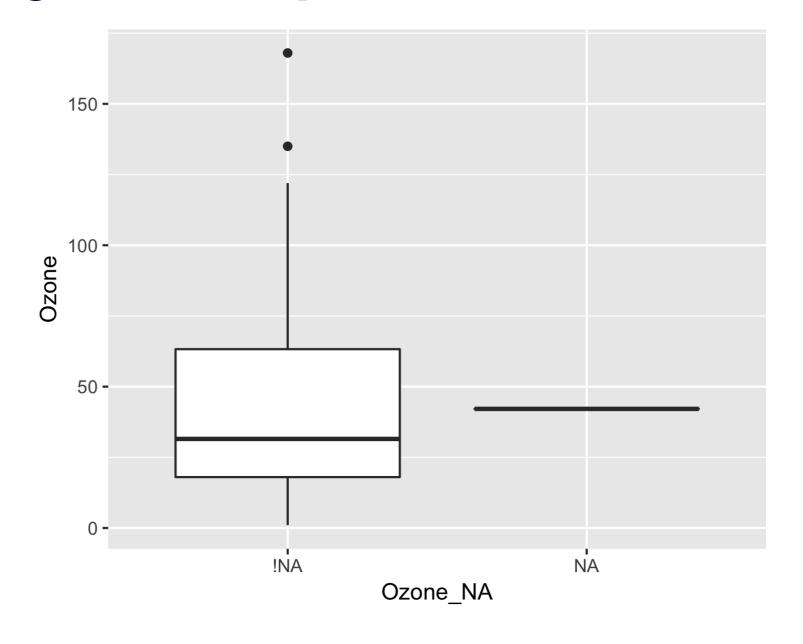

```
# A tibble: 153 x 9

Exploring imputations for many variables

Let's Practice!

DEALING WITH MISSING DATA IN R

Practicing imputing with different models

DEALING WITH MISSING DATA IN R

Nicholas Tierney
Statistician

Lesson overview

- Imputation using the simputation package
- Use linear model to impute values with impute_lm
- Assess new imputations
- Build many imputation models
- Compare imputations across different models and variables

How imputing using a linear model works

df

```
# A tibble: 5 x 3
        y x1 x2
        <dbl>        <dbl>
1        2.67        2.43        3.27
2        3.87        3.55        1.45
3        NA        2.90        1.49
4        5.21        2.72        1.84
5        NA        4.29        1.15
```

```
df %>%
  bind_shadow(only_miss = TRUE) %>%
  add_label_shadow() %>%
  impute_lm(y ~ x1 + x2)
```

```
# A tibble: 5 x 7

y x1 x2 y_NA any_missing

<dbl> <dbl> <dbl> <fct> <chr>
1 2.67 2.43 3.27 !NA Not Missing
2 3.87 3.55 1.45 !NA Not Missing
3 5.54 2.90 1.49 NA Missing
4 5.21 2.72 1.84 !NA Not Missing
5 2.56 4.29 1.15 NA Missing
```

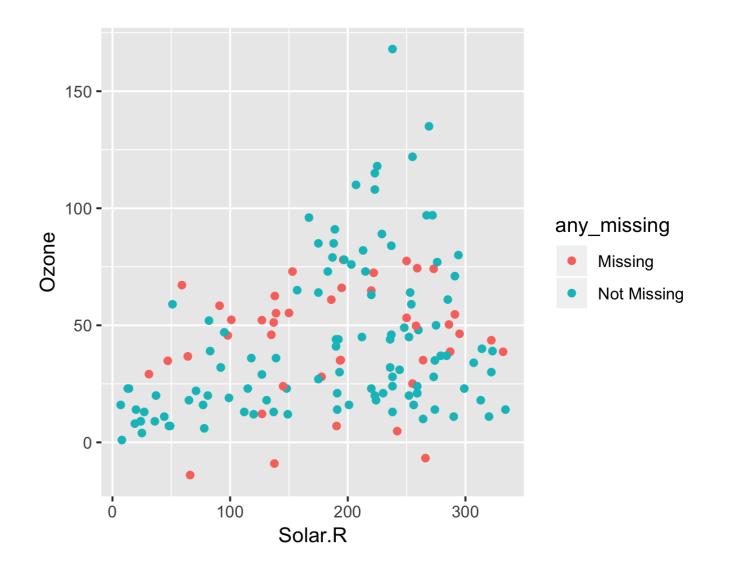

Using impute_Im

```
aq_imp_lm <- airquality %>% bind_shadow() %>% add_label_shadow() %>%
impute_lm(Solar.R ~ Wind + Temp + Month) %>%
impute_lm(Ozone ~ Wind + Temp + Month)
aq_imp_lm
```

```
# A tibble: 153 x 13
   Ozone Solar.R Wind Temp Month

Explore imputations in multiple variables and models

Let's practice!

DEALING WITH MISSING DATA IN R

Assessing inference from imputed data in a modelling context

DEALING WITH MISSING DATA IN R

Nicholas Tierney
Statistician

Exploring parameters of one model

```
lm(Temp ~ Ozone + Solar.R + Wind + Month + day, data = airquality)
```

- 1. Complete case analysis
- 2. Imputation using the imputed data from the last lesson

Combining the datasets together

```
#1. Complete cases
aq_cc <- airquality %>%
  na.omit() %>%
  bind_shadow() %>%
  add_label_shadow()
#2. Imputation using the imputed data from the last lesson
aq_imp_lm <- bind_shadow(airquality) %>%
  add_label_shadow() %>%
  impute_lm(Ozone ~ Temp + Wind + Month + Day) %>%
  impute_lm(Solar.R ~ Temp + Wind + Month + Day)
# 3. Bind the models together
bound_models <- bind_rows(cc = aq_cc,
                          imp_lm = aq_imp_lm,
                          .id = "imp_model")
```

Combining the datasets together

Exploring residuals of multiple models

Exploring predictions of multiple models

Let's practice!

DEALING WITH MISSING DATA IN R

Congratulations!

DEALING WITH MISSING DATA IN R

Nicholas Tierney Statistician

What missing values are

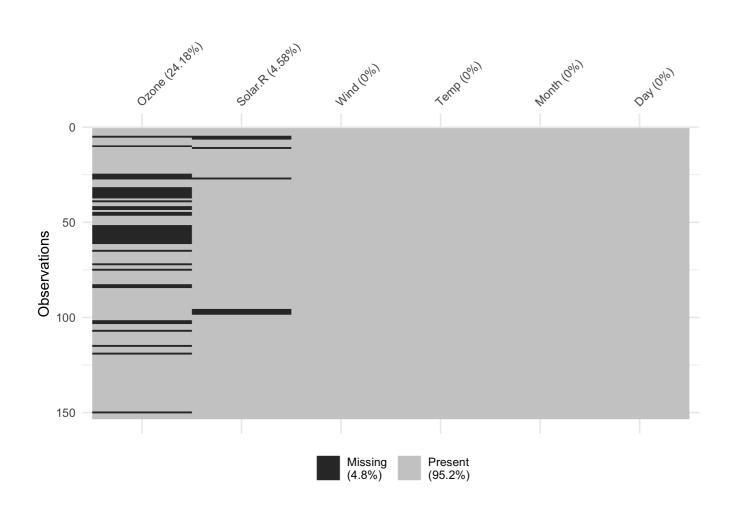

Missing values are values that should have been recorded but were not.

How to summarize missing values

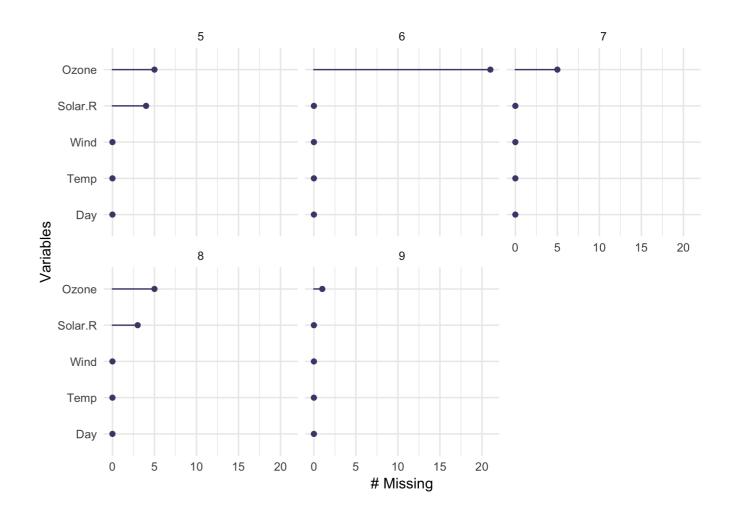

```
miss_var_summary(airquality)
```

```
A tibble: 6 x 3
 variable n_miss pct_miss
          <int>
                  <dbl>
 <chr>
1 Ozone
             37 24.2
2 Solar.R
                   4.58
3 Wind
                   0
4 Temp
                   0
5 Month
                   0
6 Day
                   0
```

vis_miss(airquality)

gg_miss_var(airquality, facet=Month)

Find alternative missing values

Replace alternative missing values

Implicit Missing values

```
frogger_tidy <- frogger %>%
  complete(time, name)
```

Missing Data Dependence

- MCAR
- MAR
- MNAR

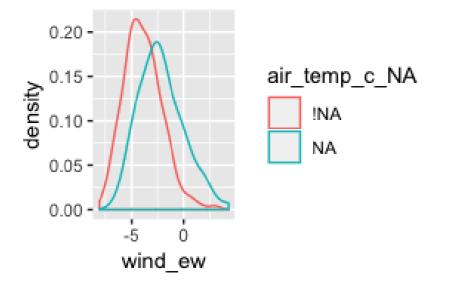

shadow matrix, nabular data

```
nabular(airquality)
```

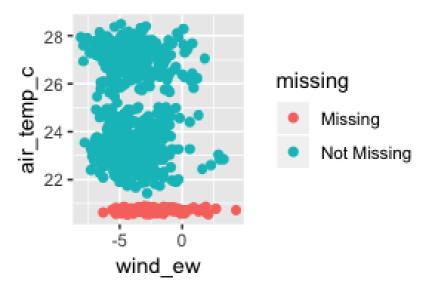

Explore missingness, link summaries to data values

```
oceanbuoys %>%
  bind_shadow() %>%
  group_by(humidity_NA) %>%
  summarize(
    wind_ew_mean = mean(wind_ew))
```

How values change with missingness.

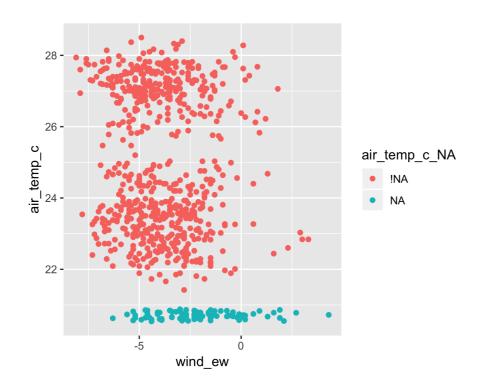

Visualize missings across 2 variables.

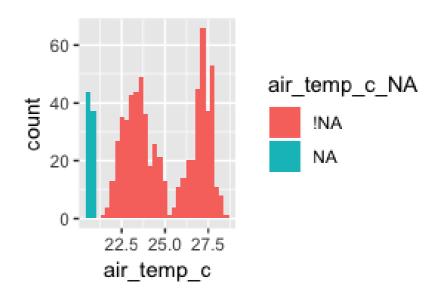

Good and bad imputations

naniar::impute_mean_all()

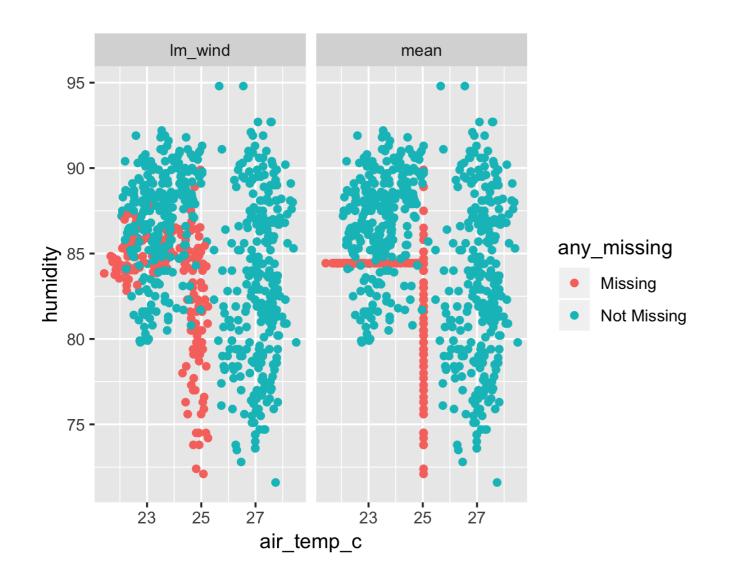

simputation::impute_lm()

Compare imputed and original values

Using different imputation models

How imputation models affect subsequent inference

```
# A tibble: 12 x 6
   imp_model term estimate
             <chr>
                      <dbl>
   <chr>
             (Int... -7.35e+2)
1 cc
             air_... 8.64e-1
2 cc
             humi... 3.41e-2
3 cc
4 cc
             year 3.69e-1
5 imp_lm_w... (Int... -1.71e+3
6 imp_lm_w... air_... 3.78e-1
# ... 6 more rows
# ... with 3 more variables:
    std.error <dbl>,
    statistic <dbl>,
    p.value <dbl>
```

This is only the beginning!

mice R package

Flexible Imputation of Missing Data

Thank you!
